

10-K SOUTH BEND GAP BED PRECISION BENCH LATHES

The 10-K Gap Bed Bench Lathe is made with 4½" foot bed and is available in three models. Model A, Model B and Model C. Also available in the Self-Contained Motor Drive Lathes with Model A, Model B and Model C. (See copy above.) The 10-K Gap Bed Lathes have a 1" gap measured from the face plate when bed insert is in place. When 4" insert is removed, the 5" gap allows 14-7/8" swing capacity. Ideal for larger work requiring boring and facing operation. All models of the 10-K Gap Bed Lathe can be supplied with either flat belt or V-belt cone pulleys for the headstock. These lathes have the same drive unit as used on the 9" lathes. Otherwise they have the same equipment as corresponding models of 10-K bench lathes described on the preceding pages. All other specifications are the same except for shipping weights. See pages 24 and 25.
